

Announcing new State-of-the-Art Modular Converting and Coating Equipment

Westborough, MA - February 15, 2008

Web Industries announces new state-of-the-art modular converting and coating equipment to broaden core capabilities, create an integrated production platform, and provide customized solutions for new and existing customers. The new line enables end-to-end process development from design through prototyping, qualification, and commercial production. Installed in a Class 100,000 clean room, the line is focused on medical, aerospace, and emerging technologies markets.

“This line allows us to process materials with a degree of control that can be tuned to the most demanding applications,” said Michael Quarrey, General Manager of Web's Hartford facility. “Servo controls, closed loop feedback, and in-line process monitoring reduce risk and simplify validation. This investment is an important element of our business model to support customers in high performance markets for printing (UV, IR), laminating, and die cutting.”

For over 40 years, Web Industries has been a leader in providing contract manufacturing and development services for flexible materials including slitting, spooling, printing, laminating, specialty extrusion, assembly, packaging, and complete supply chain management solutions.

From listening to your challenges to creating a solution and delivering the results you need, Web Industries can take the worry and the wait out of your manufacturing processes. Focus on what you do best and let Web Industries do the rest.
